# The 2014 Bethesda system for reporting cervical cytology.

### **SPECIMEN TYPE**

Indicate Conventional smear (Pap smear)Vs liquid-based preparationVs. other.

### **SPECIMEN ADEQUACY**

- Satisfactory for evaluation (describe presence or absence of endocervical/transformation zone components and any other quality indicators e.g., partially obscuring blood, inflammation, etc.).
- Unsatisfactory for evaluation (specify reason)
  - -Specimens rejected/not processed (specify reason)

-Specimens processed and examined, but unsatisfactory for evaluation of epithelial abnormality because of (specify reason).

### **GENERAL CATEGORIZATION** (optional)

- Negative for intraepithelial lesion or malignancy .
- Other: See interpretation/result
   (e.g.,endometrial cells in a women > 45 years of age).
- Epithelial cell abnormality:See interpretation/result(specify squamous or glandular as appropriate)

### INTERPRETATION/RESULT

# NEGATIVE FOR INTRAEPITHELIAL LESION OR MALIGNANCY. (NILM)

(When there is no cellular evidence of neoplasia, state this in the General

categorization above and/or in the interpretation/result section of the report – whether or not there are organisms or other non-neoplastic findings)

# NON-NEOPLASTIC FINDINGS (optional to report; list not inclusive).

- Non-neoplastic cellular variations
  - -Squamous metaplasia
  - -Keratotic changes
  - -Tubal metaplasia
  - -Atrophy
  - -Pregnancy-associated changes.
- Reactive cellular changes associated with
  - -Inflammation (includes typical repair)
    - Lymphocytic(follicular) cervicitis
  - -Radiation

- -Intrauterine contraceptive device (IUD).
- Glandular cell status post-hysterectomy
   ORGANISMS
  - -Trichomonas vaginalis
  - -Fungal organisms morphologically consistent with *Candida* spp.
  - -Shift in flora suggestive of bacterial vaginosis
  - -Bacteria morphologically consistent with *Actinomyces* spp.
  - -Cellular changes consistent with herpes simplex virus
  - -Cellular changes consistent with cytomegalovirus.

#### **OTHER**

 Endometrial cells (in a woman >45 years of age), (specify if "negative for squamous intra epithelial lesion").

# EPITHELIAL CELL ABNORMALITIES SQUAMOUS CELL

- Atypical squamous cells (ASC)
  - -Of undetermined significance (ASC -US)
  - -Cannot exclude HSIL (ASC-H)
- Low-grade squamous intraepithelial lesion(LSIL)
  - (encompassing: HPV/mild dysplasia/CIN 1)
- High grade squamous intra epithelial lesion(HSIL)
  - (encompassing moderate and severe dysplasia, CIS:CIN 2 and CIN 3)

- -With features suspicious for invasion (if invasion is suspected)
- Squamous cell carcinoma.

#### **GLANDULAR CELL**

- Atypical
  - -Endocervical cells (NOS or specify)
  - -Endometrial cells (NOS or specify)
  - -Glandular cells (NOS or specify)
- Atypical
  - -Endocervical cells (Favor neoplastic)
  - -Glandular cells (Favor neoplastic)
- Endocervical Adenocarcinoma in situ
- Adenocarcinoma
  - -Endocervical
  - -Endometrial

- -Extrauterine
- -not otherwise specified(NOS)

### **OTHER MALIGNANT NEOPLASMS** (SPECIFY)

**ADJUNCTIVE TESTING** – provide a brief description of the test method(s) and report the result so that it is easily understood by the clinician.

# COMPUTER-ASSISTED INTERPRETATION OF CERVICAL CYTOLOGY

If case examined by an automated device, specify device and result, specify device and result.

# EDUCATIONAL NOTES AND COMMENTS APPENDED TO CYTOLOGY REPORTS – (optional)

Suggestions should be consise and consistent with clinical follow-up guidelines

published by professional organizations (references to relevant publications may be included)

#### WHO (2020)-CERVIX

#### Squamous epithelial tumors

- Mimics of squamous precursor lesions
  - Squamous metaplasia
  - o Atrophy of the uterine cervix
- Squamous cell tumors and precursors
  - o Condyloma acuminatum
  - o Squamous intraepithelial lesions of the uterine cervix
  - o Squamous cell carcinoma, HPV associated, of the uterine cervix

## Protocol for the Examination of Resection Specimens From Patients With Primary Carcinoma of the Uterine Cervix

Version: 5.1.0.0

Protocol Posting Date: March 2023

CAP Laboratory Accreditation Program Protocol Required Use Date: December 2023

The changes included in this current protocol version affect accreditation requirements. The new deadline

for implementing this protocol version is reflected in the above accreditation date.

For accreditation purposes, this protocol should be used for the following procedures AND tumor types:

| Procedure      | Description                                                                  |
|----------------|------------------------------------------------------------------------------|
| Resection      | Includes radical trachelectomy, radical hysterectomy, or pelvic exenteration |
| Tumor Type     | Description                                                                  |
| Carcinoma      |                                                                              |
| Carcinosarcoma |                                                                              |

#### This protocol is NOT required for accreditation purposes for the following:

| Procedure                                                                              |  |
|----------------------------------------------------------------------------------------|--|
| Biopsy, includes Excision (Cone/LEEP) (consider Uterine Cervix Excision protocol)      |  |
| Primary resection specimen with no residual cancer (eg, following neoadjuvant therapy) |  |
| Cytologic specimens                                                                    |  |

#### The following tumor types should NOT be reported using this protocol:

| Tumor Type                                                        |
|-------------------------------------------------------------------|
| Lymphoma (consider the Hodgkin or non-Hodgkin Lymphoma protocols) |
| Sarcoma (consider Uterine Sarcoma protocol)                       |

#### **Authors**

Uma G. Krishnamurti, MD, PhD\*; Barbara A. Crothers, DO\*; George G. Birdsong, MD; Veronica Klepeis, MD, PhD; Saeid Movahedi-Lankarani, MD; Christopher N. Otis, MD.

With guidance from the CAP Cancer and CAP Pathology Electronic Reporting Committees.

<sup>\*</sup> Denotes primary author.

#### **Accreditation Requirements**

This protocol can be utilized for a variety of procedures and tumor types for clinical care purposes. For accreditation purposes, only the definitive primary cancer resection specimen is required to have the core and conditional data elements reported in a synoptic format.

- Core data elements are required in reports to adequately describe appropriate malignancies. For
  accreditation purposes, essential data elements must be reported in all instances, even if the
  response is "not applicable" or "cannot be determined."
- <u>Conditional data elements</u> are only required to be reported if applicable as delineated in the
  protocol. For instance, the total number of lymph nodes examined must be reported, but only if
  nodes are present in the specimen.
- Optional data elements are identified with "+" and although not required for CAP accreditation purposes, may be considered for reporting as determined by local practice standards.

The use of this protocol is not required for recurrent tumors or for metastatic tumors that are resected at a different time than the primary tumor. Use of this protocol is also not required for pathology reviews performed at a second institution (ie, secondary consultation, second opinion, or review of outside case at second institution).

#### **Synoptic Reporting**

All core and conditionally required data elements outlined on the surgical case summary from this cancer protocol must be displayed in synoptic report format. Synoptic format is defined as:

- Data element: followed by its answer (response), outline format without the paired Data element: Response format is NOT considered synoptic.
- The data element should be represented in the report as it is listed in the case summary. The response for any data element may be modified from those listed in the case summary, including "Cannot be determined" if appropriate.
- Each diagnostic parameter pair (Data element: Response) is listed on a separate line or in a tabular format to achieve visual separation. The following exceptions are allowed to be listed on one line:
  - Anatomic site or specimen, laterality, and procedure
  - Pathologic Stage Classification (pTNM) elements
  - Negative margins, as long as all negative margins are specifically enumerated where applicable
- The synoptic portion of the report can appear in the diagnosis section of the pathology report, at the end of the report or in a separate section, but all Data element: Responses must be listed together in one location

Organizations and pathologists may choose to list the required elements in any order, use additional methods in order to enhance or achieve visual separation, or add optional items within the synoptic report. The report may have required elements in a summary format elsewhere in the report IN ADDITION TO but not as replacement for the synoptic report ie, all required elements must be in the synoptic portion of the report in the format defined above.

#### **Summary of Changes**

#### v 5.1.0.0

- Updated "Lymphovascular Invasion" to "Lymphatic and / or Vascular Invasion"
- Updated pTNM Classification
- Updated display items associated with FIGO
- Updated Explanatory Notes B, C, D, E, and G

**Reporting Template** 

**Protocol Posting Date: March 2023** 

Select a single response unless otherwise indicated.

| Lymph nodes designated as pelvic (parametrial, obturator, internal iliac (hypogastric), external iliac, common iliac, sacral, presacral) and para-aortic are considered regional lymph nodes. Any other involved nodes should be categorized as metastases (pM1) and reported in the distant metastasis section. Presence of isolated tumor cells no greater than 0.2 mm in regional lymph node(s) is considered N0 (i+). |    |
| Not applicable (no regional lymph nodes submitted or found)                                                                                                                                                                                                                                                                                                                                                               |    |

| pT2: Carcinoma invades beyond the uterus, but has not extended onto the lower third of the vagina or to the pelvic wall. pT2a: Involvement limited to the upper two-thirds of the vagina without parametrial invasion.                                                                                                                                                           |
| pT2a1: Invasive carcinoma less than or equal to 4 cm in greatest dimension                                                                                                                                                                                                                                                                                                       |
| pT2a2: Invasive carcinoma greater than 4 cm in greatest dimension                                                                                                                                                                                                                                                                                                                |
| pT2a (subcategory cannot be determined)                                                                                                                                                                                                                                                                                                                                          |
| pT2b: With parametrial invasion but not up to the pelvic wall                                                                                                                                                                                                                                                                                                                    |
| pT2 (subcategory cannot be determined)                                                                                                                                                                                                                                                                                                                                           |
| pT3: Carcinoma involves the lower third of the vagina and/or extends to the pelvic wall and/or causes hydronephrosis or nonfunctioning kidney. Note: The pelvic wall is defined as the muscle, fascia, neurovascular structures, and skeletal portions of the bony pelvis. Cases with no cancer-free space between the tumor and pelvic wall by rectal examination are FIGO III. |
| pT3a: Carcinoma involves lower third of the vagina, with no extension to the pelvic wall                                                                                                                                                                                                                                                                                         |
| pT3b: Extension to the pelvic wall and/or hydronephrosis or nonfunctioning kidney (unless known to                                                                                                                                                                                                                                                                               |

| +FIGO Stage (2018 FIGO Cancer Report)#                                                                                                                                                                                        |
| # Please note that this section includes the Corrigendum to Revised FIGO staging for carcinoma of the cervix uteri. See the                                                                                                   |
| appropriate reference in Note G.                                                                                                                                                                                              |
| I: Carcinoma is strictly confined to the cervix (extension to the uterine corpus should be disregarded)                                                                                                                       |
| # For FIGO IA cancers, the depth of invasion should not be more than 5.0 mm taken from the base of the epithelium, either surface or glandular, from which it originates. Vascular space invasion does not alter the staging. |
| IA: Invasive cancer identified only microscopically (All gross lesions even with superficial invasion are                                                                                                                     |
| stage IB cancers) Invasion is limited to measured stromal invasion with a maximum depth of 5.0 mm#                                                                                                                            |
| ## The LAST definition of superficial invasive squamous cell carcinoma (SISCCA) conforms to FIGO IA1.                                                                                                                         |
| IA1: Measured stromal invasion of 3.0 mm or less in depth##                                                                                                                                                                   |
| IA2: Measured stromal invasion of more than 3.0 mm and not more than 5.0 mm                                                                                                                                                   |
| ### Lymphatic and / or vascular space invasion does not alter the staging.                                                                                                                                                    |
| IB: Invasive carcinoma with measured stromal invasion greater than 5.0 mm (greater than stage IA)                                                                                                                             |
| and limited to the uterus###                                                                                                                                                                                                  |
| IB1: Invasive carcinoma with measured stromal invasion greater than 5.0 mm and 2 cm or less in                                                                                                                                |
| greatest dimension                                                                                                                                                                                                            |
| IB2: Invasive carcinoma greater than 2 cm but 4 cm or less in greatest dimension                                                                                                                                              |
| IB3: Invasive carcinoma greater than 4 cm in greatest dimension                                                                                                                                                               |
| II: Carcinoma extends beyond the uterus but has not extended onto the pelvic sidewall or to the lowe third of vagina                                                                                                          |
| IIA: Carcinoma involves the upper two-thirds of the vagina without parametrial invasion                                                                                                                                       |
| IIA1: Invasive carcinoma 4 cm or less in greatest dimension                                                                                                                                                                   |
| IIA2: Invasive carcinoma 4 cm or less in greatest dimension                                                                                                                                                                   |
| IIB: Parametrial involvement but not involving the pelvic sidewall                                                                                                                                                            |
| III: Carcinoma involves the lower third of the vagina and / or extends to the pelvic sidewall and / or                                                                                                                        |
| causes hydronephrosis or nonfunctioning kidney and / or involves pelvic and / or para-aortic lymph nodes                                                                                                                      |
| IIIA: Involvement of the lower third of the vagina but no extension onto pelvic sidewall                                                                                                                                      |
| IIIB: Extension onto the pelvic sidewall, and / or causing hydronephrosis / nonfunctioning kidney                                                                                                                             |
| (unless known to be due to another cause)                                                                                                                                                                                     |

| #### Isolated tumor cells do not change the stage, but their presence should be recorded. Notations r refers to imaging and p refers to pathology.  IIIC: Involvement of pelvic and / or para-aortic lymph nodes (including micrometastases), irrespective of tumor size and extent (with r and p notations)#####  IIIC1: Pelvic lymph node metastasis only  IIIC2: Para- aortic lymph node metastasis  ###### Involvement of the uterine or pelvic serosa and / or fallopian tubes alone does not constitute FIGO Stage IV disease, but is considered M1 disease in the AJCC / UICC system. #### **Explanatory Notes**

#### A. Procedure

#### Specimen Orientation

If the specimen is the product of a cone biopsy or an excisional biopsy, it is desirable for the surgeon to orient the specimen to facilitate assessment of the resection margins (e.g., stitch at 12 o'clock). The laterality of the specimen is in reference to the patient's perspective. Clock values refer to the cervix from the viewer's perspective (face on). However, specimens frequently are received without orientation. In these cases, the clock face orientation is designated by the pathologist and is arbitrary.

#### Examination of Bladder and Rectum

Currently, pelvic exenterations are rarely seen, but typically when performed indicate advanced tumor stage. In these cases, the extent of tumor involvement of the urinary bladder and rectum and the relation of that tumor to the cervical carcinoma should be described. To evaluate these features, sections of the rectum and bladder should be taken perpendicular to the mucosa directly overlying the tumor in the cervix. A method that provides excellent orientation of the tumor to adjacent structures consists of inflation of the urinary bladder and rectum with formalin and fixation of the specimen for several hours. The entire specimen can then be hemisected through the neoplasm, and appropriate sections can be obtained.

#### **B. Tumor Size**

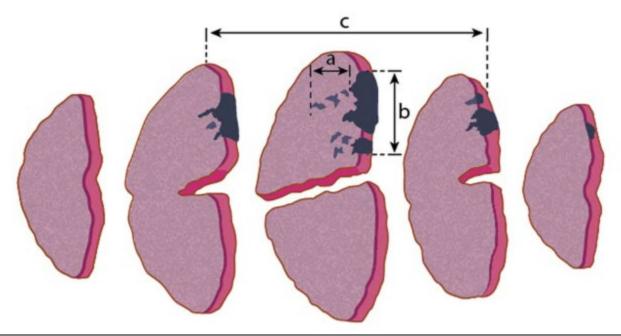

#### Tumor Size Measurement

Larger tumors are more accurately measured grossly, while smaller tumors and some larger tumors with a diffusely infiltrative pattern or with marked fibrosis are best measured microscopically. It is best to report only one set of tumor measurements based on a correlation of the gross and microscopic features to avoid confusion. According to the 2018 FIGO staging system for all stages the size of the primary tumor can be assessed by clinical evaluation (pre- or intraoperative), imaging, and/or pathological measurement. However, in surgically treated cases, the pathologist's findings should take priority over clinical or image-based staging and should be used for the pathological staging.

The depth of invasion is required for the sub-staging of Stage 1 carcinomas in the latest FIGO staging system (2018)¹ and in the latest AJCC system (2020)². The depth of invasion is measured from its HSIL origin, that is, from the base of the epithelium, whether epithelial surface or an endocervical gland that is involved by HSIL to the deepest point of invasion. If the invasive focus or foci are not in continuity with the dysplastic epithelium, the depth of invasion should be measured from the deepest focus of tumor invasion to the base of the nearest dysplastic crypt or surface epithelium. If there is no obvious epithelial origin, the depth is measured from the deepest focus of tumor invasion to the base of the nearest surface epithelium, regardless of whether it is dysplastic or not. In situations where carcinomas are exclusively or predominantly exophytic, there may be little or no invasion of the underlying stroma. These should not be regarded as in situ lesions and the tumor thickness (from the surface of the tumor to the deepest point of invasion) should be measured. The depth of invasion below the level of the epithelial origin should not be provided in these cases, as this may not truly reflect the biological potential of these tumors. If it is impossible to measure the depth of invasion, e.g., in ulcerated tumors or in some adenocarcinomas, the tumor thickness may be measured instead, and this should be clearly stated on the pathology report along with an explanation for providing the thickness rather than the depth of invasion.

The depth of stromal invasion in fractional thirds in resections is a data point in the NCCN guidelines that guides clinical management.<sup>3.4</sup>

FIGURE 1. Measurement of Cervical Tumors in 3 Dimensions<sup>5</sup>

**FIG. 1.**CIN3 with involvement of endocervical gland crypts is represented by the dark blue-colored areas, nondysplastic squamous epithelium is pink, and gray areas indicate foci of stromal invasion. The depth of invasion (a), and horizontal tumor dimension/width (b) are measured in unifocal disease. Third dimension: when stromal invasion is present in 3 or more consecutive blocks of a loop or cone biopsy the third tumor dimension (c), may exceed 7mm, that is the carcinoma may be more than International Federation of Obstetricians and Gynaecologists stage IA2. This dimension is determined by calculating the block thickness (usually 2.5–3.0 mm) from the macroscopic specimen dimensions and multiplying this by the number of sequential blocks through which the invasion extends.

#### Horizontal Extent

This is now an optional element in the synoptic template. It is no longer included in the AJCC staging update and is no longer used for sub-staging of Stage I carcinomas in the 2018 FIGO staging system. However, some still feel that horizontal spread may have prognostic significance in early stage cervical cancer. The collection of horizontal spread data is encouraged to create an opportunity for future analysis and individual clinicians may request a horizontal extent for their practice.

The horizontal extent may be the longitudinal extent (length) measured in the superior-inferior plane (i.e., from the endocervical to ectocervical aspects of the section), or it may be the circumferential extent (width) that is measured or calculated perpendicular to the longitudinal axis of the cervix. When a gross lesion is not identified, the measurement accuracy of horizontal extent may be limited. If the extent is measured on a single glass slide, this may underestimate the true horizontal extent, because the tumor may involve multiple blocks and may have a greater "width" than "length". The thickness of sections of the cervix, which are often taken as "wedges" of a cone may be variable and may range from less than 1.0 mm to greater than 3.0 mm. In addition, adding thicknesses of adjacent sections where the sections are

taken as a cone are measuring the circumference rather than a linear "width". Estimates using a thickness of 2.5 mm to 3.0 mm may overestimate the true tumor extent. The pathologist should report the maximum horizontal extent (when it is on a single block) and where multiple blocks are involved, they should report the number of blocks involved and if it is estimated as less than or equal to 7.0 mm or greater than 7.0 mm.

To summarize, horizontal extent data is an optional element and has been excluded from the staging update. However, the collection of horizontal spread data is encouraged.

The Lower Anogenital Squamous Terminology (LAST)<sup>7</sup> definition of superficial invasive squamous cell carcinoma (SISSCA) conforms to T1a1/ FIGO IA1 and defines what would have been previously reported as "microinvasive" squamous cell carcinoma. The LAST consensus recommends that SISCCA include multifocal disease and that reporting include the presence, number, and size of independent multifocal carcinoma. However, LAST makes no recommendation on the methodology to measure multifocal disease. Multifocal tumors should be defined as invasive foci separated by a tissue block within which there is no evidence of invasion, as invasive foci in the same tissue block that are more than 2.0 mm apart, or as invasive foci on different cervical lips. They recommend that multifocal tumors should be staged based on the largest focus.<sup>7</sup>

#### Silva Pattern of Invasion

Silva patterns of invasion are applicable only to HPV-associated invasive endocervical adenocarcinomas. Accurately measuring the depth of stromal invasion can be challenging in some endocervical adenocarcinomas. The Silva system of classification<sup>§</sup> stratifies cases of invasive endocervical adenocarcinomas into three groups on the basis of the morphologic pattern of invasion and is predictive of the risk for LN metastasis. Briefly, Pattern A shows well-demarcated glands with rounded contours, frequently forming groups with no destructive stromal invasion, no single cells or cell detachment and no LVI. Complex intraglandular growth such as cribriform or papillary architecture is acceptable but there is no solid growth. Pattern B shows localized (limited, early) destructive stromal invasion. There are individual or small groups of tumor cells, separated from the rounded gland, in a focally desmoplastic or inflamed stroma. There is no solid growth and LVI may or may not be present. Pattern C shows diffuse destructive stromal invasion. There are diffusely infiltrative glands with associated extensive desmoplastic response. Growth pattern is confluent or solid and LVI may or may not be present. Pattern A cases were all stage I with negative lymph nodes and no recurrences. Pattern B tumors rarely had metastatic lymph nodes and only 23.8% of cases with pattern C had lymph node metastases.

| Silva Pattern <sup>8</sup> | Histologic Appearance                                                                          |  |  |
|----------------------------|------------------------------------------------------------------------------------------------|--|--|
| Α                          | Demarcated, complete, rounded glands, frequently forming groups on low power                   |  |  |
|                            | Cribriform and papillary growth is possible, but solid (nonglandular) growth is not            |  |  |
|                            | No desmoplastic stroma                                                                         |  |  |
|                            | Lacks single or detached cells                                                                 |  |  |
|                            | No lymphovascular invasion                                                                     |  |  |
|                            | Relationship of tumor to large cervical vessels and depth of tumor are not relevant to pattern |  |  |
| В                          | Localized or limited destructive (desmoplastic) stromal invasion arising in Pattern A          |  |  |
|                            | Buds of small glands or individual cells from rounded glands (often in an inflamed or focally  |  |  |
|                            | desmoplastic stroma), often with increased cytoplasm or maturation                             |  |  |
|                            | Single, multiple or linear (base of tumor) foci are acceptable                                 |  |  |
| İ                          | No solid growth pattern                                                                        |  |  |

|                                                                                     | Lymphovascular invasion may or may not be present                                        |  |  |  |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|--|--|--|
| С                                                                                   | Diffuse growth pattern with destructive (often extensive desmoplastic) stromal invasion  |  |  |  |
|                                                                                     | Confluent growth of glands, papillae, or mucin lakes filling 4X field (5 mm)             |  |  |  |
|                                                                                     | Angulated, often incomplete or discontinuous glands (breaks opening into the stroma)     |  |  |  |
|                                                                                     | Canalicular (labyrinthine, interconnected glandular) pattern with occasional open glands |  |  |  |
| Solid or poorly differentiated component (high grade); nuclear grade is disregarded |                                                                                          |  |  |  |
|                                                                                     | Lymphovascular invasion may or may not be present                                        |  |  |  |

#### C. Histologic Type

For consistency in reporting, the histologic classification proposed by the World Health Organization (WHO) is recommended;¹ other classification systems may be used, however. A majority of cervical squamous cell carcinomas are HPV-associated. p16 testing and/or molecular HPV typing is recommended before making the diagnosis of HPV-associated cervical SCC. If these results are not available, the NOS category should be used. 75% of HPV-associated adenocarcinomas are of the usual type. Villoglandular, mucinous NOS, intestinal, signet ring cell, and SMILE (stratified mucin-producing) carcinoma are all patterns of HPV-associated adenocarcinomas. There is now a general consensus that most or all serous carcinomas detected in the cervix represent metastasis or direct extension from adnexal or endometrial serous carcinomas, although conclusive studies to support this have yet to be published.

#### D. Histologic Grade

A wide variety of grading systems, including some that evaluate only the extent of cellular differentiation and others that assess additional features such as the appearance of the tumor margin, the extent of inflammatory cell infiltration, and vascular invasion, have been used for squamous cell carcinoma of the cervix. However, there is no consensus emerging from the literature that any of these systems are reproducible or that they provide useful prognostic information, so no particular system is recommended. For the grading of invasive squamous tumors, it is suggested that three grades be used:

- GX Cannot be assessed
- G1 Well differentiated
- G2 Moderately differentiated
- G3 Poorly differentiated

It is uncertain whether grading has independent prognostic value in cervical ACA. Whilst a correlation between higher grade and adverse outcomes has been reported, at least for poorly differentiated tumors, this has not been a universal finding. Most grading systems are based on the tumor architecture (glandular and papillary versus solid areas) and its nuclear features. In contrast to squamous cell carcinoma, most authors who grade cervical adenocarcinoma have found the grade to have prognostic value. 1.2.3.4

- G1 Small component of solid growth and mild to moderate nuclear atypia
- G2 Intermediate between grades 1 and 3
- G3 Solid pattern with severe nuclear atypia

Tumors with no differentiation or minimal differentiation that is discernible only in rare, tiny foci (undifferentiated carcinomas by WHO classification) are categorized as Grade 4.

Neuroendocrine tumors of the cervix have a separate grading system mirroring neuroendocrine tumors of other body sites. The 2020 WHO classifies uterine cervix neuroendocrine tumors into two categories: low-grade neuroendocrine tumor (including grades 1 and 2) and high-grade neuroendocrine carcinoma (including small cell neuroendocrine carcinoma and large cell neuroendocrine carcinoma), along with a "mixed" category with other carcinoma. By definition, the high-grade tumors are grade 3.34.5 High-grade neuroendocrine tumors of the cervix are typically HPV-associated, most frequently HPV subtypes 16 or 18.

#### E. Lymphatic and/or Vascular Invasion

Many gynecologists feel that the presence of lymphatic and/or vascular invasion is important because it may change the extent of their surgical treatment and may be an independent risk factor for recurrence. 1.2.3.4 At times, it may be difficult to evaluate a specimen for lymphatic and/or vascular invasion, as in cases with crush artifact or suboptimal fixation. In these cases, it can be categorized as "cannot be determined". At other times, it may be difficult to be definitive whether lymphatic and/or vascular invasion is present. This can include cases where retraction artifact or artifactual transfer of tumor cells is a consideration. In other cases, foci may be suspicious but not definitive for invasion. All of these situations can be categorized as "equivocal for invasion". In cases where one cannot be definitive, a qualifying note explaining the interpretive difficulty and the extent of possible involvement is recommended, since it may help to direct medical management. 2.5.6.7

#### F. Resection Margins

Margins can be involved, negative, or indeterminate for carcinoma. If a margin is involved, whether endocervical, ectocervical, deep, or other, it should be specified. If indeterminate, the reason should be specified (e.g., cautery artifact in electroexcision specimens may preclude evaluation of the status of the

margin). The severity and extent of a precursor lesion (e.g., focal or diffuse) involving a resection margin of a cone should be specified.

If an invasive tumor approximates but does not directly involve a resection margin, the distance between the tumor and the margin should be measured in millimeters. If the tumor involves the uterine corpus, a determination of whether the cervix or corpus is the primary site should be made.

In hysterectomy or trachelectomy specimens, the lateral radial margin may consist of parametrial soft tissue, which should be measured if present. If a parametrectomy has been performed, a measurement from the side of the uterus to the lateral edge of each unstretched parametrium (lateral extent) should be recorded and calculated into the margin evaluation. If parametrectomy has been performed, careful microscopic examination of the parametria is important for evaluation of the lateral margins and/or soft tissue extension. Fragments of paracervical/ parametrial soft tissue that may be present in sections of cervix from a simple hysterectomy do not represent a formal parametrectomy. Anterior and posterior radial/deep stromal margins in a hysterectomy specimen will consist of cervical stromal tissue.

 McCluggage WG, Judge MJ, Alvarado-Cabrero I, et al. Data set for the reporting of carcinomas of the cervix: recommendations from the International Collaboration on Cancer Reporting (ICCR). Intl J Gynecol Pathol. 2018;37(3):205–228.

#### G. Pathological Classification

The TNM categories for cervical cancer endorsed by the American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC), and the parallel system formulated by the International Federation of Gynecology and Obstetrics (FIGO), are recommended. 12.3.4.5.6 This does not preclude the use of other staging systems.

By AJCC/UICC convention, the designation "cT" refers to a primary tumor that has not been previously treated. The symbol "p" refers to the pathologic classification of the TNM, as opposed to the clinical classification, and the pathologist's contribution is based on gross and microscopic examination after primary surgical treatment. pT entails a surgical treatment resection of the primary tumor or biopsy adequate to evaluate the highest pT category and highest pN categories, pN entails removal or biopsy of nodes adequate to validate lymph node metastasis, and pM implies microscopic examination of distant lesions. Clinical classification (cTNM) is usually carried out by the referring physician before treatment during initial evaluation of the patient. Pathological classification (pTNM) must be assigned by the managing physician based on the clinical stage information, the operative findings, and the gross and microscopic examination of the surgical resection specimen. The pathologist provides vital information, but it is not the patient's final pT, pN, and/or pM categories.

#### **TNM Stage Classifications**

<u>The "y" prefix</u> indicates those cases in which classification is performed during or following initial multimodality therapy (i.e., neoadjuvant chemotherapy, radiation therapy, or both chemotherapy and radiation therapy). The cTNM or pTNM category is identified by a "y" prefix. The ycTNM or ypTNM categorizes the extent of tumor actually present at the time of that examination. The "y" categorization is not an estimate of tumor prior to multimodality therapy (i.e., before initiation of neoadjuvant therapy).

<u>The "r" prefix</u> indicates a recurrent tumor when staged after a documented disease-free interval, and is identified by the "r" prefix: rTNM.

#### **TNM Suffixes**

For identification of special cases of TNM or pTNM classifications, the "(m)" T suffix and "(sn)" and "(f)" N suffixes are used. Although they do not affect the stage grouping, they indicate cases needing special analysis.

<u>The "(m)" T suffix</u> indicates the presence of multiple primary synchronous tumors in a single site and is recorded in parentheses: e.g., pT1(m).

<u>The "(sn)" N suffix</u> indicates a sentinel node procedure only, without resection of the nodal basin, was performed and is recorded in parentheses: e.g., pN1(sn).

<u>The "(f)" N suffix</u> indicates a fine needle aspiration (FNA) or core needle biopsy, without a sentinel node procedure or resection of nodal basin, was performed and is recorded in parentheses: e.g., pN1(f)

Of note, tumor size has been shown to have prognostic utility for stage I to stage II lesions, and the 2018 FIGO staging classification uses tumor size for the subclassification of stage I and stage IIa tumors.

The CAP protocols follow the AJCC/UICC staging guidance and vocabulary, which may predate staging guidance from editions of the WHO Classification of Tumours and/or conflict with FIGO staging guidance. Although the ultimate goal is harmonization of these 3 guidelines, discrepancies in the CAP protocol may occur due to release date variability of these manuscripts. The AJCC Cancer Staging System, 9th edition (2020), cervical cancer staging chapter includes guidance for pM1 that contains the statement, "Uterine serosa and adnexal involvement are considered M1 disease" (Table 1) and this conflicts with the definition of M - Distant Metastasis in the WHO Classification of Tumours, 5th edition, Female Genital Tumours, which states for cervix: "M1 – Distant metastasis (includes inguinal lymph nodes and intraperitoneal disease). It excludes metastasis to the vagina, pelvic serosa, and adnexa." The AJCC/UICC, WHO and FIGO criteria for stage IV disease differ due to limited evidence for consensus. Involvement of the ovary and/or fallopian tube for tumors limited to the cervix constitutes M1 disease in AJCC (involves the fallopian tube and/or ovary), but is stage I in FIGO, (organs are within the true pelvis).

#### T Category Considerations

#### Lymphatic and/or Vascular Invasion (LVI)

LVI indicates whether microscopic lymphatic and/or vascular invasion is identified. By AJCC/UICC convention, LVI does not affect the T category indicating local extent of tumor unless specifically included in the definition of a T category.

#### N Category Considerations

Sentinel lymph node sampling in cervical carcinoma has been recently implemented. Sentinel nodes should be sliced at 2.0 mm intervals. The sentinel nodes should undergo ultrastaging. Currently, there is no universal ultrastaging protocol. However, all institutions undertaking sentinel lymph node examination should have a standard procedure in place for sentinel lymph nodes. One protocol is as follows: For any section that is negative on initial H&E section, 2 sections are taken from each of two levels that are 50  $\mu$ m apart, with one for H&E and the second for pankeratin immunohistochemistry.

There is little data to assign risk for nonsentinel lymph node metastasis based on the size of the metastasis in the sentinel lymph node. However, the size criteria for micrometastasis and macrometastasis is adopted from the experience in breast carcinoma. Micrometastasis is defined as a metastasis measuring greater than 0.2 mm but less than or equal to 2.0 mm.

Isolated tumor cells (ITCs) are single cells or small clusters of cells not more than 0.2 mm in greatest dimension, or single cells or clusters of cells less than or equal to 200 cells in a single lymph node cross section. Lymph nodes or distant sites with ITCs found by either histologic examination (e.g., immunohistochemical evaluation for cytokeratin) or nonmorphological techniques (e.g., flow cytometry, DNA analysis, polymerase chain reaction [PCR] amplification of a specific tumor marker) should be so identified. There is currently no guidance in the literature as to how these patients should be coded; until

more data are available, they should be coded as "N0(i+)" with a comment noting how the cells were identified.

#### Examination of Parametria

The parametria may be measured grossly, but their width varies according to the elasticity of the tissue. The parametria should not be stretched during measurement. Careful microscopic examination of the parametria is important for evaluation of the lateral margins and/or soft tissue extension.

#### H. Special Studies

#### p16 Immunohistochemistry

Immunohistochemistry (IHC) serves as an important adjunct to the histologic diagnosis of high grade squamous intraepithelial lesion (HSIL) in difficult cases, with p16 immunoreactivity serving as a surrogate marker for high-risk human papillomavirus (HPV) infection. Squamous epithelial p16 immunostaining should be diffuse and strong in both nuclei and cytoplasm to support HPV etiology. Focally strong nuclear and cytoplasmic p16 staining may be identified not only in dysplastic squamous epithelium, but also in benign squamous epithelium. p16 immunostaining is also considered a better candidate (rather than HPV in situ hybridization) for the initial assessment of cervical biopsies that are histologically indeterminate for HSIL, given its wide availability, easy interpretation, and high sensitivity and specificity. However, due to the heterogeneous staining patterns seen in low-grade squamous intraepithelial lesions (LSIL), p16 immunohistochemistry is generally reserved for lesions that are morphologically suspicious or indeterminate for HSIL. The LAST project proposed that p16 be used in 3 specific situations. First, to distinguish inflammatory lesions from HSIL; second, to distinguish LSIL from HSIL; and third, to evaluate specimens such as endocervical curettage in patients who have previously had a recent HSIL diagnosis.

It should not be used if the biopsy shows identifiable LSIL or HSIL. ProEx C, an immunohistochemical assay targeting both topoisomerase II-alpha and minichromosome maintenance protein-2 (MMP-2), has been shown to have high sensitivity and specificity for HPV-associated lesions of the cervix, with similar staining patterns as those seen for p16 and MIB-1 (Ki-67).<sup>5</sup>

#### Immunohistochemistry: Endocervical versus Endometrial Adenocarcinoma

Immunohistochemistry can also be helpful in the differential diagnosis between endocervical and endometrial carcinoma, especially in curettage specimens, since endometrial carcinomas may show mucinous differentiation. A panel of antibodies, rather than a single antibody, is most useful; in most instances this includes vimentin, ER, p16, and monoclonal CEA.<sup>6.7</sup> Typically, endometrioid adenocarcinoma is positive for vimentin and ER, whereas endocervical adenocarcinoma is positive for p16 and mCEA, but exceptions occur.

#### **CASE NO 1**

AGE/SEX: 61 YEAR/MALE

#### SPECIMEN: DEEP KNIFE BIOPSY FROM RIGHT BUCCAL MUCOSA

CLINICAL DIAGNOSIS: ? CARCINOMA RIGHT BUCCAL MUCOSA, Leukoerythroplakic patch of 1x1 cm in right buccal mucosa, reformed tobacco chewer.

Observe the hyperplastic epithelium in tissue bit marked with **2 blue dots**. Also, note the degree of dysplasia in basal layer. Note the nuclear characteristics.

Observe the degree of dysplasia in small tissue bit marked with **one blue dot**. Observe the basement membrane.

**EPITHELIUM SHOWING MILD DYSPLASIA.** 

AGE / SEX: 46 YR/MALE

# **SPECIMEN: DEEP PUNCH BIOPSY, RIGHT TONGUE**

CLINICAL DIAGNOSIS: Leucoplakia of tongue right side. Patches over right side of tongue

Observe the hyperplastic epithelium of the tongue. Note the nuclear atypia extending into the middle third of the epithelium at marked site.

Observe the submucosa, Note the presence of epithelial cell cluster in submucosa surrounded by lymphocytes at marked site.

AGE/SEX: 56/FEMALE

# **SPECIMEN: DEEP PUNCH BIOPSY, LEFT SIDE OF TONGUE.**

CLINICAL DIAGNOSIS: Leucoplakia of tongue left side. Erthroplakic Patch over left border of tongue

Observe the normal epithelium at one end and abnormal epithelium at other end.

Observe the degree of atypia and extent in the abnormal region of the epithelial lining.

Note the atypical mitotic figure.

COMPARE THE DEGREE OF DYSPLASIA WITH CASE NO 1 AND CASE NO 2.

IMPRESSION: SEVERE DYSPLASIA

AGE/SEX: 61/MALE

#### **SPECIMEN: BIOPSY FROM RIGHT ANGLE OF LIP.**

CLINICAL DIAGNOSIS: Ulceroproliferative growth over right angle of lip.

Oberve the lining epithelium thrown into papillary projection in one of the tissue bit marked with a blue line.

IMPRESSION: Tissue bit showing Verrucous hyperplasia.

AGE /SEX: 60 YEAR / MALE

#### **SPECIMEN: EXCISION BIOPSY FROM LIP.**

CLINICAL DIAGNOSIS: Oral leukoplakia. Whitish patch over lip since 5-6 yrs.

Oberve the hyperkeratosis and irregular downward proliferation of epithelium.

Observe the submucosa for the amount of connective tissue.

Note the architectural and cytological characteristics of the epithelial cells.

IMPRESSION: Leukoplakia without dysplasia.

AGE /SEX: 33 YEAR /MALE

#### **SPECIMEN: BIOPSY FROM BUCCAL MUCOSA.**

**CLINICAL DIAGNOSIS: Oral submucous fibrosis.** 

Observe the subepithelial tissue for the amount and nature of collagen compare it with case no 5.

IMPRESSION: Submucosal fibrosis

AGE/SEX: 51YEAR /FEMALE

#### **SPECIMEN: BIOPSY RIGHT LATERAL BORDER OF TONGUE**

CLINICAL DIAGNOSIS: Growth measuring 3x2 cm on right lateral border of tongue

Observe the verrucous growth projecting above the level of normal mucosa seen at one end of the section.

Impression: VERRUCOUS HYPERPLASIA

AGE / SEX: 62/FEMALE

#### **SPECIMEN: BIOPSY FROM LEFT LOWER GBS**

CLINICAL DIAGNOSIS: Ulceroproliferative lesion present over left mandibular alveolus.

Identify the tumor with formation of keratin pearls.

Impression: Well differentiated squamous cell carcinoma

AGE/SEX: 34/MALE

#### **SPECIMEN: BIOPSY FROM TONGUE**

CLINICAL DIAGNOSIS: Non-healing ulcer measuring 1x3 cm in left lateral border of tongue since 6 months

Note the hyperplasia of mucosal of epithelium at one end of the section.

Ulcerated tumor showing downward proliferation in stroma. Keratin pearls are seen

Impression: Well differentiated squamous cell carcinoma

AGE /SEX: 76/MALE

#### **SPECIMEN: BIOPSY FROM TONGUE**

**CLINICAL DIAGNOSIS: Non-healing ulcer in left side of soft palate.** 

Observe the degree of differentiation in tumor cells.

Impression: Moderately differentiated squamous cell carcinoma

AGE / SEX: 46/MALE

#### **SPECIMEN: BIOPSY FROM DORSUM OF TONGUE**

CLINICAL DIAGNOSIS: Non-healing ulcer over dorsum of tongue 2x2 cm.

Observe the keratinization inn tumor cells and keratin pearl formation.

Note nuclear features of tumor cells.

IMPRESSION: Moderately differentiated squamous cell carcinoma.

Impression: Moderately differentiated squamous cell carcinoma

AGE/SEX: 40 YEAR/MALE

# SPECIMEN: NECK LN FROM A CASE OF CARCINOMA RIGHT BUCCAL MUCOSA.

CLINICAL DIAGNOSIS: carcinoma right buccal mucosa.

Observe architecture of lymph node, presence of tumor and morphological variation in tumor cells from polygonal to spindle shaped cells.

Impression metastatic deposits in LN from SCC.

AGE/SEX: 9 YEAR/FEMALE

#### **SPECIMEN: SWELLING IN CHEEK**

CLINICAL DIAGNOSIS: SLIDE FOR REVIEW.

Observe the morphology of spindle cell tumor and nuclear atypia in different fields.

Impression: spindle cell tumor with uncertain malignant potential.

AGE/SEX: 85 YEAR/FEMALE

#### **SPECIMEN: SWELLING IN MENTAL REGION**

**CLINICAL DIAGNOSIS: SCHWANNOMA OF MENTAL NERVE** 

Observe the morphology of the tumor.

Note the gland formation and presence of mucin.

Note morphology of individual tumor cells

Impression: Malignant salivary gland tumor.

#### **EXCISION SPECIMEN REPORTING**

AGE/SEX: 35 YEAR / MALE

SPECIMEN: WIDE LOCAL EXCISION OF RIGHT TONGUE WITH MODIFIED RADICAL NECK DISSECTION.

# CLINICAL DIAGNOSIS: CARCINOMA RIGHT LATERAL BORDER OF TONGUE.

A 1: Ulcer with anterior margin (radial)

A2: Posterior margin (shaved)

A3: Ulcer with superior margin (radial)

A4: Ulcer with inferior margin (radial)

A5: Tumor with inked base (radial)

A6: Tumor proper.

Measure the distance of the tumor from all margins and base

Measure the depth of invasion of the tumor

Comment on the PNI and LVI
